Enterohemorragic Escherichia coli O157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell. WPI; 2003-451640/43. 24-JAN-2001; 2001JP-00112010. (UYTS-) UNIV TSUKUBA.

The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the Sequence 558 Claim 3; SEQ ID NO 844; 2067pp; Japanese.

comprises computing sequence-based attributes of protein sequences using neural network software and training an artificial neural network.

Claim 16; SEQ ID NO 20; 402pp; English.

CC identifying adhesin and adhesin-like proteins, by computing the sequenceCC based attributes of protein sequences using five attribute modules of a
CC each of the computed five attributes, and identifying the adhesin and
CC each of the computed five attributes, and identifying the adhesin and
CC edhesin-like proteins having probability of being an adhesin (Pad) as
CC equal or greater than 0.51. Also claimed is a set of 1274 annotated genes
CC encoding adhesin and adhesin-like proteins, having 274 fully defined 162CC 11151 base pair (SEQ ID NO: 385-658) sequences; a set of 105 hypothetical
CC genes encoding adhesin and adhesin-like proteins, having 105 fully
CC defined 306-15876 base pairs (SEQ ID NO: 659-763); a set of 1279 annotated
CC adhesin and adhesin-like proteins, having 279 fully defined 53-3716 base
CC pair (SEQ ID NO: 1-279); a set of 105 hypothetical adhesin and adhesin-like proteins, having 279 fully defined 53-3716 base
CC 280-384) sequences; and a fully connected multilayer feed forward ANN (I)
CC based on (MI). (MI) is useful for identifying adhesin and adhesin-like
CC proteins for further testing in development of new vaccine formulations
CC useful for identifying putative adhesins that are important in drug
CC discovery and preventing therapeutics for whooping cough, pneumonia,
CC gastric ulcer and urinary tract infections. (MI) identifies adhesins from
CC unique proteins. The present sequence is a microbial pathogen adhesin
CC unique proteins. The present sequence is a microbial pathogen adhesin

Sequence 558 AA;

                                                                       S
                                                                                                                                                                                       The present invention relates to novel EspFU polypeptides and their corresponding polymucleotides. The EspFU polypeptides are EspF-like CC corresponding polymucleotides. The EspFU polypeptides are EspF-like CC polypeptides encoded by genes of the cryptic prophage CP-933U of CC coli (EPEC) that binds to a neuronal wiskott-aldrich syndrome protein (N-CC wasp) polypeptide or restores the actin pedestal formation activity of CC enteropathogenic E. coli (EPEC) strain KC12. The invention further CC relates to a method of identifying a candidate compounds capable of CC binding to and/or modulating the activity of EspFU and compounds that CC inhibits protein-protein interactions between EspFU and EspFU-interacting proteins such as N-WASP, transducer of Cdc42-dependent actin assembly-1 CC (Toca-1) and p21-activated kinase 1 (Pakl). EspFU polymucleotides are CC useful for treating BHEC infection. The present sequence is the CC enterohemorrhagic Escherichia coli translocated intimin receptor (Tir) circum. This sequence is critical for the formation of actin pedestals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ

The sequence was deduced from an isolated tir CC polynucleotide (see AAX58859). Tir proteins are secreted by attaching and CC effacing pathogens such as EHEC and EPEC (see AAY06220) E. coli. The CC bacterial pathogens sinsert their own receptors into mammalian cell CC surfaces, to which the pathogen then adheres to trigger additional host Signaling events and actin nucleation. Diagnosis of disease caused by CC pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the protein or the use of nucleic acid probes for detection of mucleic acids encoding Tir polypeptide. Isolated Tir nucleic acids, Tir CC peptides, a recombinant method for producing recombinant Tir, antibodies which bind to Tir, and a kit for the detection of Tir-producing E. coli care provided. A method of immunising a host with Tir to induce a CC protectins can be used in attenuated E. coli to induce a cell-mediated constraint for compounds which interfere with the binding of bacterial contents that the compounds which interfere with the binding of bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches 528;

The present sequence represents Tir, a novel translocated intimin CC (EPEC) strain. The sequence was deduced from an isolated tir CC (EPEC) strain. The sequence was deduced from an isolated tir CC (EPEC) strain. The sequence was deduced from an isolated tir CC polynucleotide (see AAX58858). Tir proteins are secreted by attaching and CC effacing pathogens such as EPEC and EHEC (see AAY06221) E. coli. The CC surfaces, to which the pathogen then adheres to trigger additional host CC signaling events and actin nucleation. Diagnosis of disease caused by CP pathogenic E. coli can be performed by use of antibodies that bind to Tir CC to detect the protein or the use of nucleic acid probes for detection of CC nucleic acids encoding Tir polypeptide. Isolated Tir nucleic acids, Tir peptides, a recombinant method for producing recombinant Tir, antibodies which bind to Tir, and a kit for the detection of Tir-producing E. coli care provided. A method of immunising a host with Tir to induce a proteins can be used in attenuated E. coli to induce a cell-mediated CC immune response to other polypeptides, e.g. antigens. A method for compounds which interfere with the binding of bacterial CC pathogens to their receptors is further provided
                                                                                                                                                                                                                                                                                                                                                                                    New translocated intimin receptor useful for treating infection enteropathogenic or enterohemorrhagic Escherichia coli.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    118
```

present invention describes a

method

of screening

for

an inhibitor

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling

cell signalling and

18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 infections cause a histopathological effect known as attachment and effacement on intestinal epithelial cells. The inhibitors can be used to produce food supplements or additives, especially where the food is a milk substitute. The method can be used to sort cells based on their ability to bind to a Tir independent cell binding domain of an intimin polypeptide. Polypeptides having Tir-independent intimin binding activity can be used to produce a vaccine against a bacterial disease. The present sequence represents a specifically claimed intimin C-terminal Tir binding domain amino acid sequence, for use in the method of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         intimin binding to eukaryotic cells. The method comprises exposing an intimin polypeptide having a Tir-independent cell binding activity to test agents, and obtaining an inhibitor based on its ability to bind the polypeptide. The inhibitors are used in the prevention, treatment and/or diagnosis of bacterial infections, preferably by enteropathic and/or enterohaemorrhagic Escherichia coli, Shiga toxigenic E. coli, Hafnia alvei or Citrobacter freundii, or especially E. coli 0157:H7. The

The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL6176-ABL30511), expressed DNA sequences (ABL016176) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format direct from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 2586
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of

The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCF primers and hybridisation probes used in the isolation of the PRO

                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleoids may also be used in gene therapy
                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; Fig 138;

Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals screen for modulators of the compounds. and ő

Ł,

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of a mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, treast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders the animal

The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as

Eaton DL, Fi Grimaldi JC, Filvaroff C, Gurney Į, Gerritsen Watanabe £, ₩ Goddard A, Wood WI; Godowski

New isolated secreted and transmembrane PRO polypeptide useful for modulating biological activity of a cell, or for treating sports-related joint problems, osteoarthritis or rheumatoid arthritis.

Claim 20; Fig 100; 399pp; English.

CC antibodies which specifically bind to the proteins. The proteins are considered of containing an polypeptide designated as A, B, C or D in a sample consisted of containing an A, B, C or D polypeptide, by contacting the consumpte with a polypeptide designated as E, F, G, H or I (or vice versa) cand determining the formation of a A/E, B/F, B/G, C/H or D/I polypeptide conjugate in the sample, where the formation of the conjugate is conjugate in the sample, where the formation of the conjugate is conjugate in the sample, where A is a PRO10272 polypeptide, B is a PRO20110 polypeptide, C is a conformation of the conjugate is a PRO1096 polypeptide, D is a PRO19760 polypeptide, E is a PRO50010 polypeptide, F is a PRO1096 polypeptide, B is a PRO20110 polypeptide, H is a conformation of a propertide and I is a PRO1890 polypeptide, E is a PRO2033 polypeptide and I is a PRO1890 polypeptide. The sample comprises considered the proteins are useful for linking a bioactive molecule coule to a cell support. The proteins are useful for linking a bioactive molecule causes death of the cell. A, B, C or D or E, F, G, H, or I. The bioactive molecule causes death of the cell. A, B, C, D, E, F, G, H, C, F, G, H, or I can be cell expressing a polypeptide designated as A, B, C, D, E, F, G, H, C, F, G, H, problems, articular cartilage derects, observations are useful as arthritis. Nucleic acids encoding the proteins are useful as hybridisation probes, in chromosome and gene mapping, in the generation of anti-sense RNA and DNA, for the preparation of the proteins, to generate transgenic or knockout animals which are useful in the development and screening of therapeutic useful reagents, for chromosome identification, and in gene therapy. The antibody is useful as a therapeutic agent, in a diagnostic assay and for affinity purification of the protein from recombinant cell culture natural sources. The present proteins, as molecular weight markers for protein electrophoresis purposes, and as therapeutic agents for treating sports-related joint purposems, articular cartilage defects, osteoarthritis or rheumatoid problems, articular cartilage defects, osteoarthritis or rheumatoid The invention relates to an isolated secreted and transmembrane PRO polypeptide having 80 % sequence identity to a sequence appearing as ABG95851-ABG95934 or their associated signal peptide, or a sequence of an extracellular domain of the proteins with their associated signal peptide extracellular domain of the proteins with their associated signal peptide. Also included are the nucleic collaboration of the sequence of a collaboration of the proteins with their associated signal peptide. Also included are the nucleic collaboration of the sequence of a extracellular domain of the proteins with their associated signal peptide. Also included are the nucleic collaboration of the sequence of a collaboration of acids encoding the proteins, vectors, host cells, fusion proteins and

Sequence A
